

Lab 4 —: DEVOPS-1

Task: Validate the /version API endpoint

Task management and Git collaboration

This task was tracked in Jira as **DEVOPS-1**, with acceptance criteria requiring an HTTP 200 response, a JSON object containing the application version, and a passing integration test.

The work was performed on the branch feature/DEVOPS-1-version-endpoint. Jira successfully linked this branch, commit 7b4e381. The pull request was merged into main, and the Story was marked **Done**.

 DEVOPS-1

Create /version API endpoint

Terminé

 Done 

 +

Description

As a developer, I want to provide a /version API route, so that the app can expose its current version number.

Acceptance Criteria:

- GET /version returns { "version": "x.x.x" }
- Response code = 200
- Integration test test/version.test.js must pass
- Commit and branch include  DEVOPS-1:

Contribution and automated validation

All **15 tests across 7 test files passed**. Global coverage reached **93.18% for lines, 92.15% for statements, 81.81% for functions, and 72.22% for branches**, meeting the required thresholds. The /version route achieved **100% coverage**. Some application startup code remains untested, as shown by the report (screenshot 6). The GitHub Actions check also passed before the pull request was merged.

Manual verification

The application was started using `npm run dev` and requested `http://localhost:3000/version` using `curl.exe -i`. The server returned **HTTP 200 OK**, the content-type `application/json; charset=utf-8`, and the expected response:

```
{"version":"1.0.0"}
```

These results confirm that the endpoint behaves correctly both during automated testing and when the server is running locally

```
