Student : Zixuan Qian

My task was to implement and test the appointments API in the existing Lab 4 project.

I completed the JavaScript practice exercises, covering variables, arrays, objects, functions, modules, error handling and asynchronous code.

I implemented two endpoints: GET /api/appointments, which returns the appointment list with HTTP 200, and POST /api/appointments, which creates an appointment with HTTP 201 and a unique ID. The required fields are doctor, patient and date. Missing, empty or non-string fields return HTTP 400 without adding an appointment. I also enabled JSON body parsing using express.json().

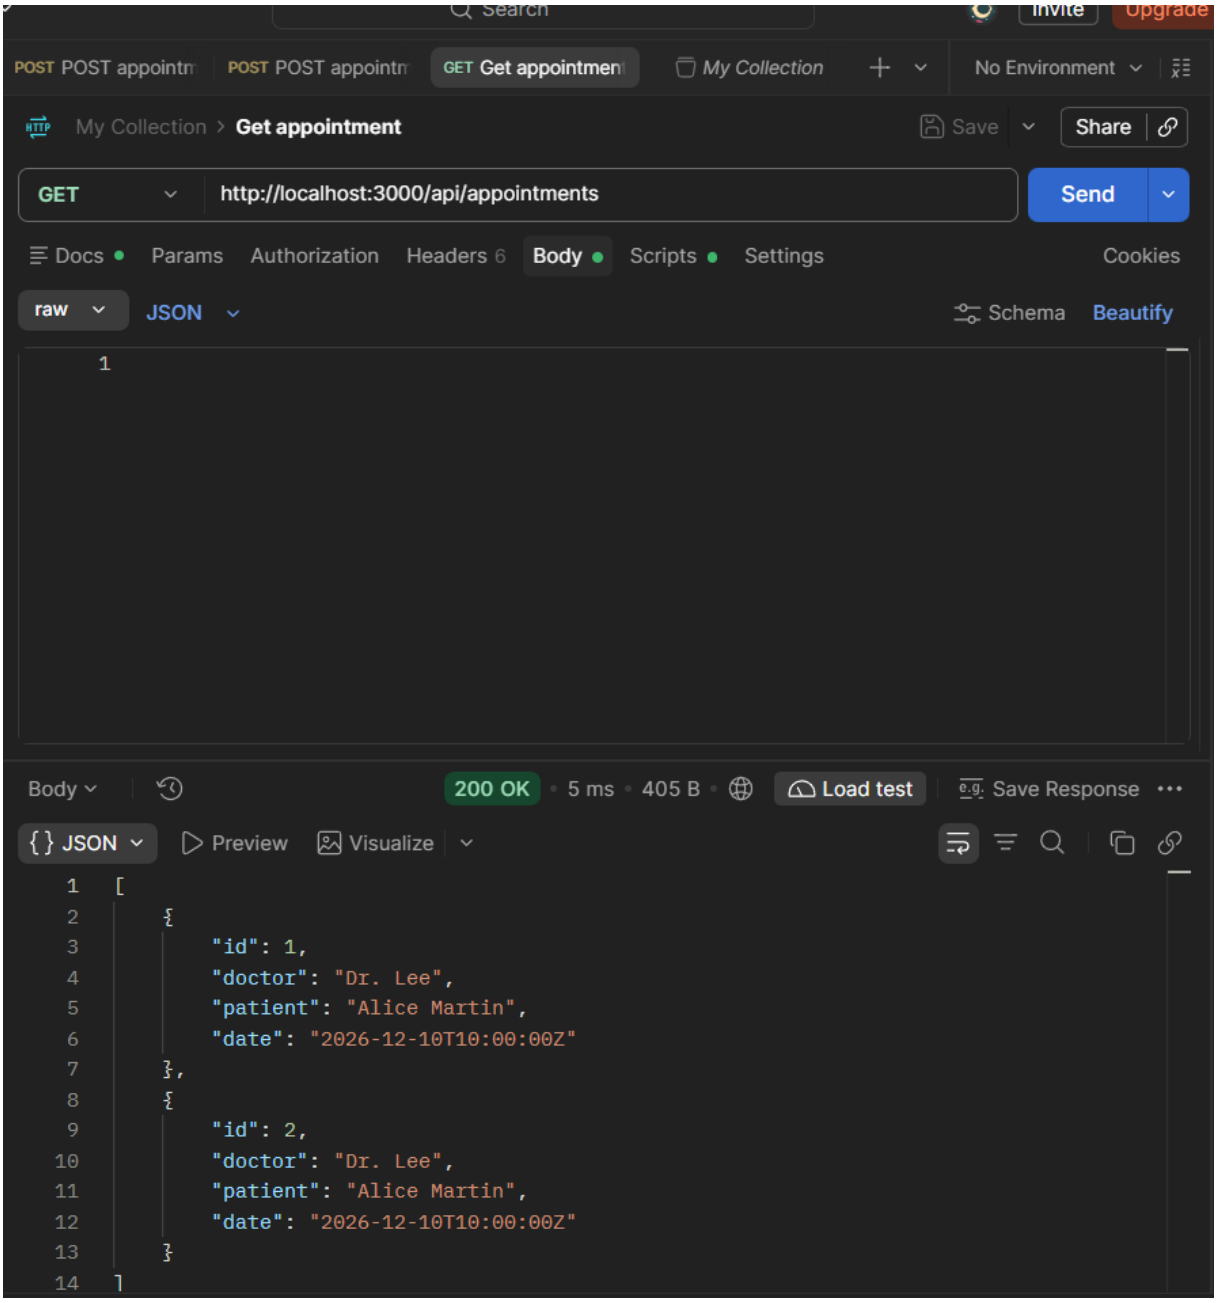

Appointments are stored in memory and reset when the server restarts. Date format validation and duplicate prevention are not implemented.

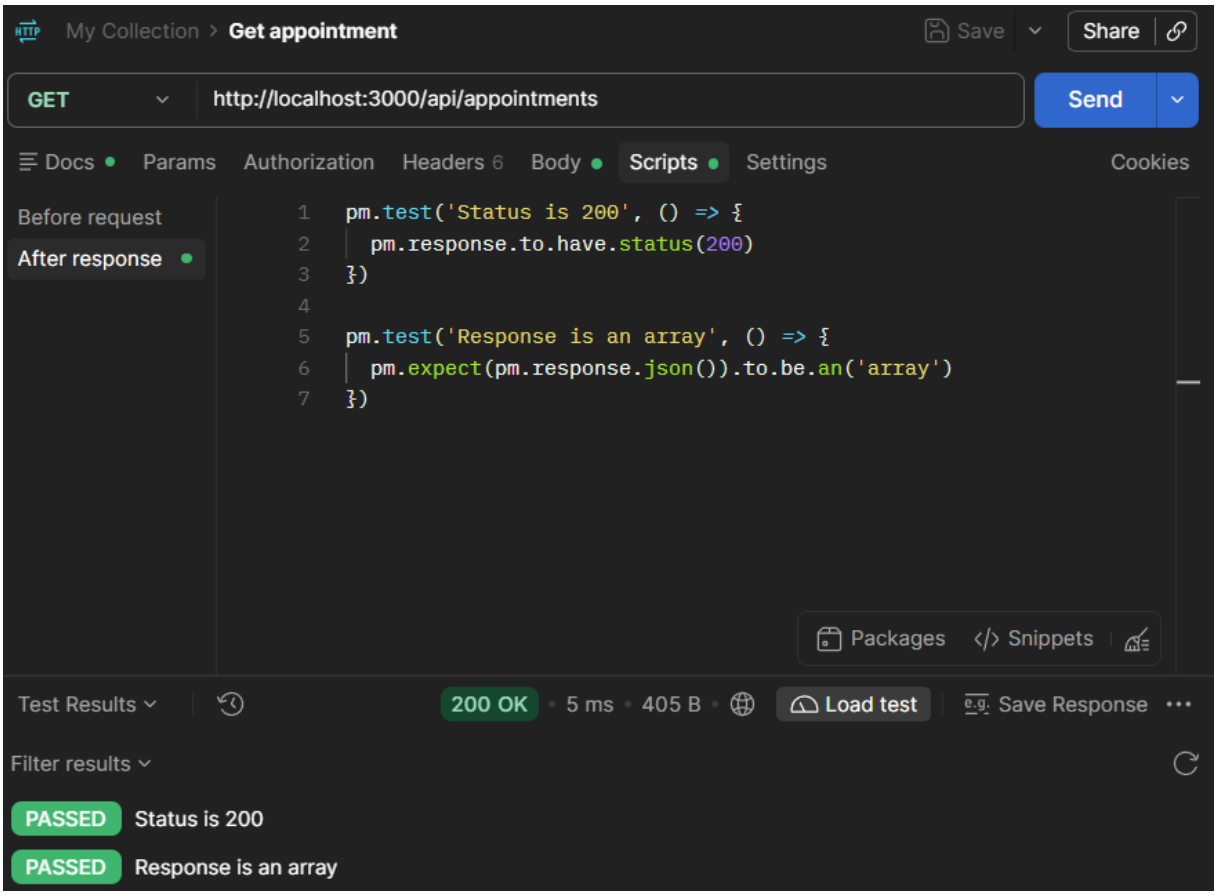

Testing and results

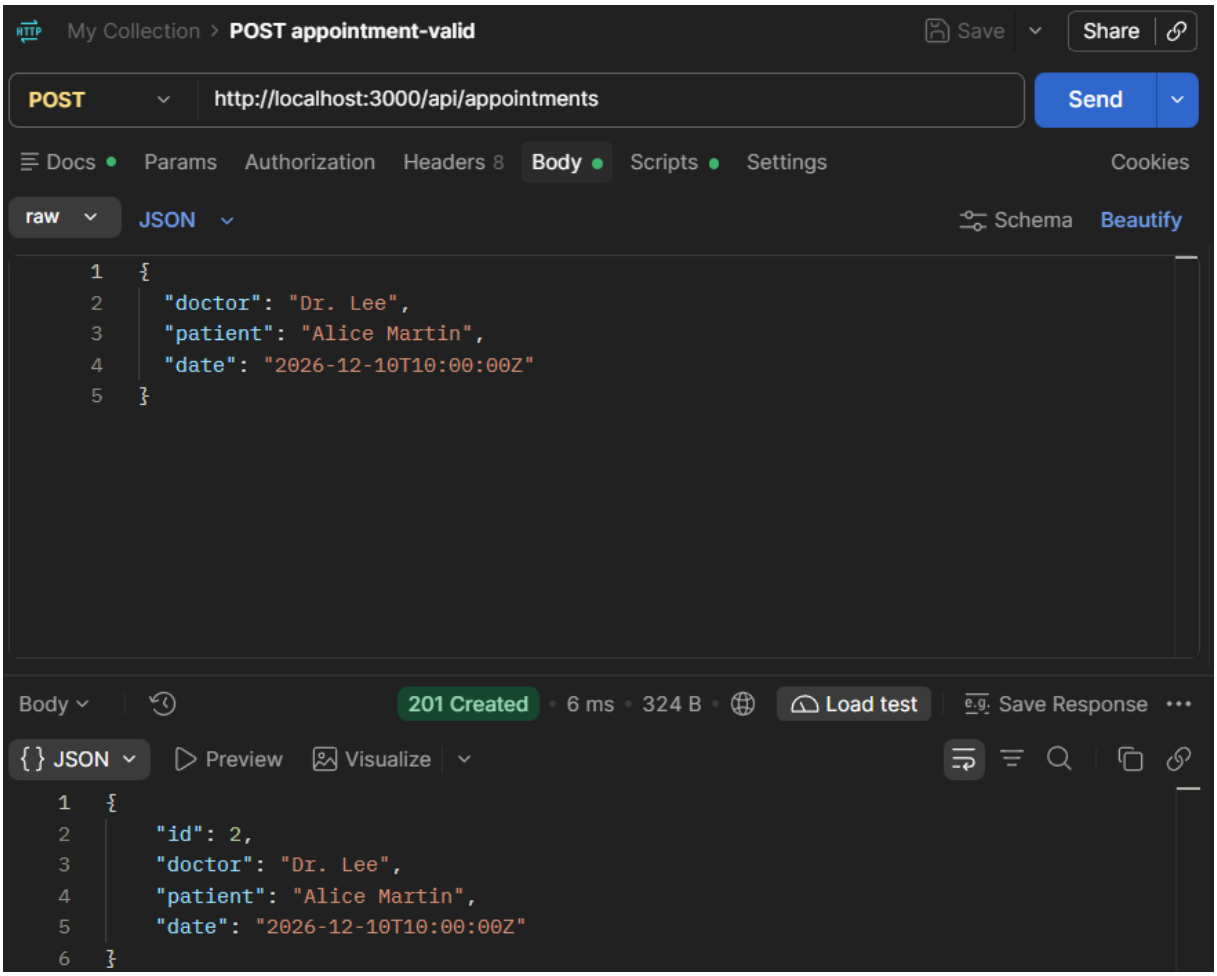

I added 20 automated integration tests for appointments. They check retrieval, creation, unique IDs, whitespace trimming and rejection of invalid requests. After integrating the patient feature from the shared branch, all 45 project tests passed and ESLint reported no errors.

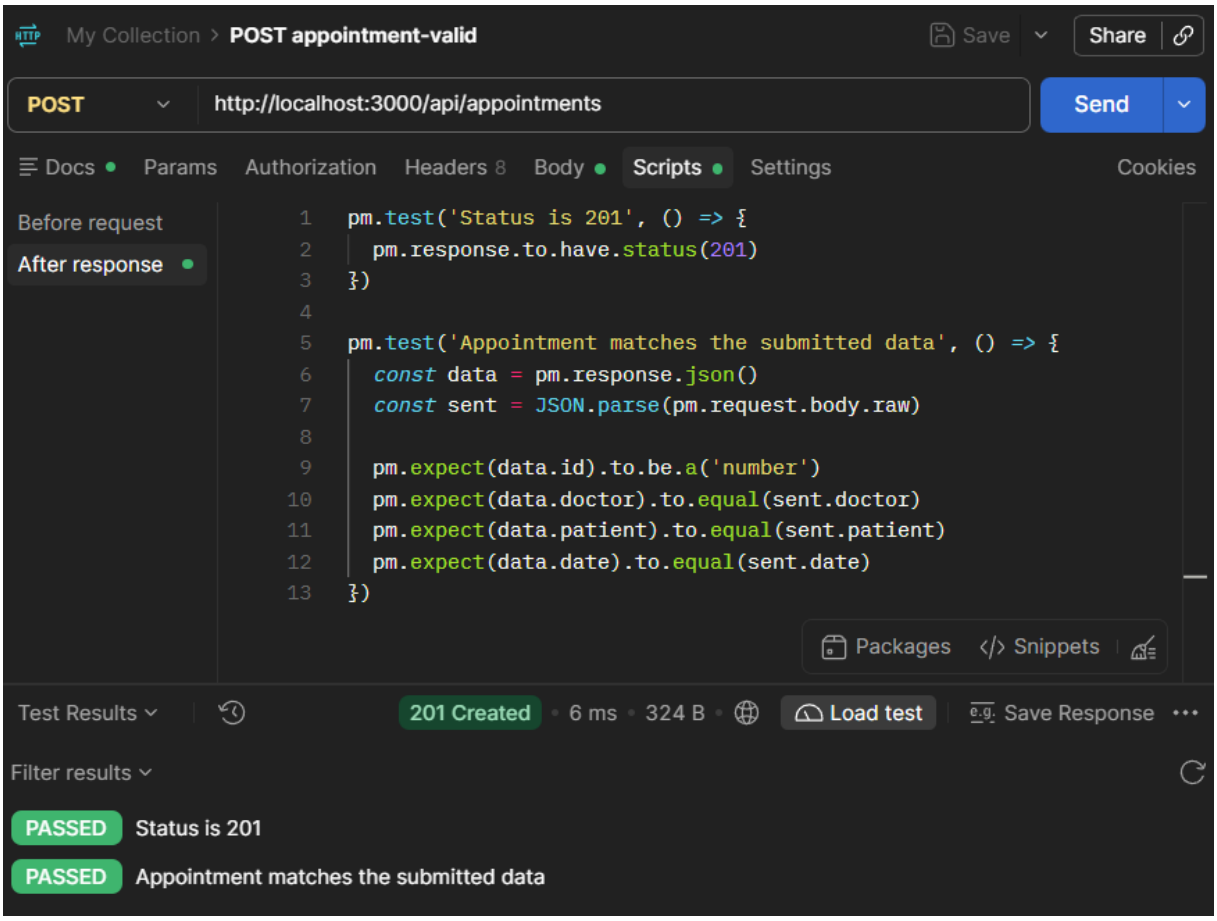

Global coverage reached **95.83% for lines, 95% for statements, 87.5% for functions and 78.12% for branches**, meeting the project thresholds.

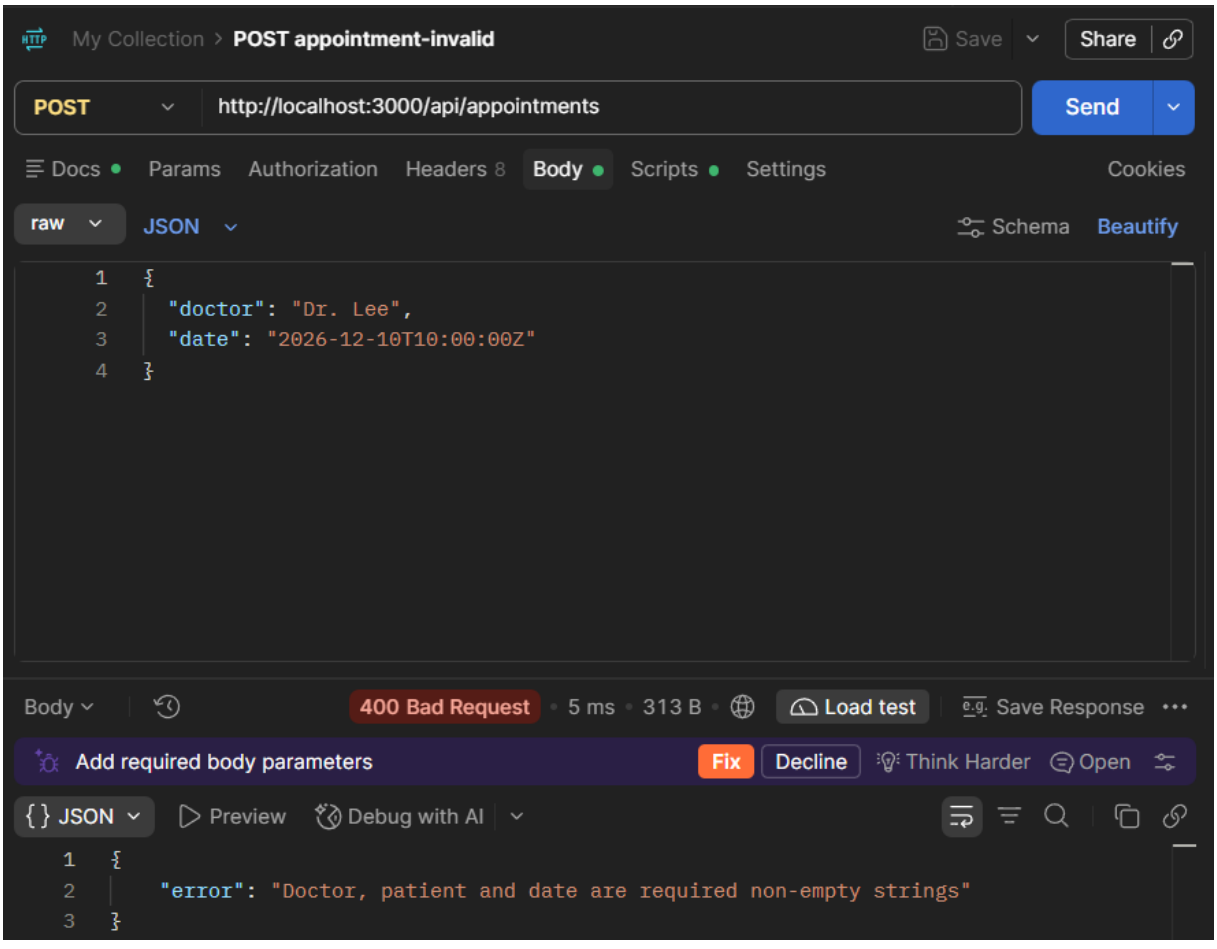

I also verified the API in Postman using one GET request, one valid POST and one invalid POST. All six Postman assertions passed. The collection was exported and committed under postman/.

Git and Jira workflow

I tracked my work in Jira Story **DEVOPS-9** and developed it on feature/DEVOPS-9-appointments. I opened Pull Request **#6** and resolved conflicts involving the shared JavaScript practice files by retaining the versions from main. After successful CI validation, the PR was merged and the Story was marked Done.

DEVOPS-5 / DEVOPS-9

Implement appointments API

Description

As a hospital staff member,
I want to create and view appointments,
so that I can schedule visits between doctors and patients.

Acceptance criteria:

- GET /api/appointments returns an array with HTTP 200.
- POST /api/appointments accepts doctor, patient and date.
- A valid appointment receives a unique ID and HTTP 201.
- Missing or empty required fields return HTTP 400.
- A rejected request does not create an appointment.
- Automated tests pass and coverage meets the project thresholds.
- The endpoints are verified with Postman.

For this lab, appointments are stored in memory and reset when the server restarts.
